```

SUBBUNIT: MUSCLE SODIUM CHANNELS CONTAIN AN ALPHA SUBUNIT AND A SMALLER BETA SUBUNIT.
SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
DOMAIN: THE SEQUENCE CONTAINS 4 INTERNAL REPEATS, EACH WITH 5 HYDROPHOBIC SEGMENTS (31, 22, 33, 25, 56) AND ONE POSITIVELY CHARGED SEGMENT (S4). SEGMENTS 54 ARE PROBABLY THE VOLTAGE-SENSORS AND ARE CHARACTERIZED BY A SERIES OF POSITIVELY CHARGED AMINO ACIDS AT WHICH NA+ IONS MAY PASS IN ACCORDANCE WITH THEIR ELECTROCHEMICAL GRADIENT. THIS SODIUM CHANNEL MAY BE PRESENT IN BOTH DENERVATED AND INNERVATED SKELETAL MUSCLE.

EVERY THIRD POSITION.

DISEASE: DEFECTS IN SCN4A ARE THE CAUSE OF BOTH HYPERKALEMIC DISEASE: DEFECTS IN SCN4A ARE THE CAUSE OF BOTH HYPERKALEMIC BRENOUT PARLYSIS (HYPP) AND PARAMYOTONIA CONGENITA (PMC) WHICH ARE NOW BOTH KNOWN AS SODIUM CHANNEL DISEASE. CHARACTERIZED BY MUSCLE STIFFNESS DUE TO MEMBRANE HYPEREXCITABILITY. SIMILARITY: TO OTHER SODIUM CHANNEL PROTEINS.

SIMILARITY: CONTAINS 1 1Q DOMAIN.

Res. 7:467-497(1987).
- FUNCTION: THIS PROTEIN MEDIATES THE VOLTAGE-DEPENDENT SODIUM ION PERMEABILITY OF EXCITABLE MEMBRANES. ASSUMING OPENED OR CLOSED CONFORMATIONS IN RESPONSE TO THE VOLTAGE DIFFERENCE ACROSS THE MEMBRANE, THE PROTEIN FORMS A SODIUM SELECTIVE CHANNEL THROUGH WHICH NA++ IONS MAY PASS IN ACCORDANCE WITH THEIR ELECTROCHEMICAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primary structure of Electrophorus electricus sodium channel deduced

                                                                                                                                                                                  SUBCELLOLAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
ALTERNATIVE PRODUCTS: AT LEAST THREE DIFFERENT FORMS ARE PRODUCED
BY ALTERNATIVE SPLICING OF THE PARA GENE.
DOMAIN: THE SEQUENCE CONTAINS 4 INTERNAL REPEATS, EACH WITH 5
HYDROPHOBIC SEGMENTS ($1,$2,$3,$5,$6) AND ONE POSITIVELY CHARGED
SEGMENT ($4). SEGMENTS $4 ARE PROBABLY THE VOLTAGE-SENSORS AND ARE
CHARACTERIZED BY A SERIES OF POSITIVELY CHARGED AMINO ACIDS AT
SURLARITY: TO OTHER SODIUM CHANNEL PROTEINS.
                                       Proc. Natl. Acad. Sci. U.S.A. 86:2079-2082(1989).
-1- FUNCTION: THIS PROPEIN MEDIATES THE VOLTAGE-DEPENDENT SODIUM ION PERMEMBELLITY OF EXCITABLE MEMBRANES. ASSUMING OPENED OR CLOSED CONFORMATIONS IN RESPONSE TO THE VOLTAGE DIFFERENCE ACROSS THE MEMBRANE, THE PROTEIN FORMS A SODIUM-SELECTIVE CHANNEL THROUGH WHICH NA++ IONS MAY PASS IN ACCORDANCE WITH THEIR ELECTROCHEMICAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Interro, .......rrans; 4. -1- TISSUE SPECIFICITY: HEART AND UTERUS.
-1- DOMAIN: THE SEQUENCE CONTAINS 4 INTERNAL REPEATS, EACH WITH 5
HYDROPHOBIC SEGMENTS (S1, S2, S3, S5, S6) AND ONE POSITIVELY CHARGED
SEGMENT (S4). SEGMENTS S4 ARE PROBABLY THE VOLTAGE-SENSORS AND ARE
CHARACTERIZED BY A SERIES OF POSITIVELY CHARGED AMINO ACIDS AT
EVERY THIRD POSITION.
-1- SIMILARITY: TO OTHER SODIUM CHANNEL PROTEINS.
                                                        1647
                                                                            1707
                                                                                                                                                        Proc. Natl. Acad. Sci. U.S.A. 89:4893-4897(1992).
-1- FUNCTION: THIS PROTEIN MEDIATES THE VOLTAGE-DEPENDENT SODIUM ION PERMEABILITY OF EXCITABLE MEMBRANES. ASSUMING OPENED OR CLOSED CONFORMATIONS IN RESPONSE TO THE VOLTAGE DIFFERENCE ACROSS THE MEMBRANE, THE PROTEIN FORMS A SODIUM-SELECTIVE CHANNEL THROUGH WHICH NA++ IONS MAY PASS IN ACCORDANCE WITH THEIR ELECTROCHEMICAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PRINTS; PR00170; NACHANNEL.

Tinsect calcium channels. Molecular cloning of an alpha 1-subunit from housefly (Musca domestica) muscle."; housefly (Musca domestica) muscle."; tebs Lett. 339:189-194(1994).

C. -!- FUNCTION: VOLTAGE-SENSITIVE CALCIUM CHANNELS (VSCC) MEDIATE THE ENTRY OF CALCIUM IONS INTO EXCITABLE CELLS AND ARE ALSO INVOLVED IN A VARIETY OF CALCIUM-DEPENDENT PROCESSES, INCLUDING MUSCLE CONTRACTION, HORMONE OR NEUROTRANSMITTER RELEASE, GENE EXPRESSION, C CELL MOTILITY, CELL DIVISION AND CELL DEATH (BY SIMILARITY) MDL-ALPHA INCODES A DIHYDROPYRIDINE- AND DILITAZEM-SENSITIVE CURRENT IN LARVAL BODY WALL MUSCLE.

C. -- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

C. -- TISSUE SPECIFICITY: PREDOMINANTIX EXPRESSED IN THE LARVAL BODY WALL MUSCULATURE. IN ADULTS, HIGHEST EXPRESSION IN THORAX FOLLOWED BY HEAD AND AT A LOWER EXTENT BY ABDOMEN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. DOMAIN: EACH OF THE FOUR INTERNAL REPEATS CONTAINS FIVE
HYDROPHOBIC TRANSMEMBRANE SEGNENTS (S1, S2, S3, S5, S6) AND ONE
POSITIVELY CHARGED TRANSMEMBRANE SEGMENT (S4). S4 SEGMENTS
POSSTITYELY CHARGED TRANSMEMBRANE SEGMENT (S4). S4 SEGMENTS
SERIE OF POSITIVELY CHARGED AND ARE CHARACTERIZED BY A
SERIE OF POSITIVELY CHARGED ANDINO ACIDS AT EVERY THIRD POSITION.
SIMILARITY: BELONGS TO THE CALCIUM CHANNEL ALPHA-1 SUBUNITS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                            all regions were double stranded, sequenced with an alternate chemistry. or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This clone was derived from human PAC library RPCI-6, prepared by Pieter de Jong and coworkers at Roswell Park Cancer Institute, using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from one female donor. For further details, see http://bocpac.med.buffalo.edu/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The clone sequenced to the left is RP1-261D10; the clone sequenced to the right is RP5-1163111, 200 bp overlap. Actual start of this clone is at base position 1 of RP6-91H8; actual end is at base position 1 28202 of RP6-91H8.
                                                                                                                                                                       not represent the entire insert of this
                                                                                                                                                                NOTICE: This sequence may not represent the entire insert of this colone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc
